(ALPHA, BETA, & GAMMA), LINKED TO EACH OTHER BY DISULFIDE BOND
ALTERNATIVE PRODUCTS: THIS CHAIN DIPERERS FROM THE GAMMA-A CHAI
AT RESIDARS 434-47 FOLLOWED BY 16 ADDITIONAL RESIDUES OF THE
CARBOXYL END. THESE DIFFERENCES ARE PRODUCED BY AN ALTERNATE
                                                                                                                                                                                                                                               SPLICING OF THE MRNA IN WHICH THE EIGHTH (LAST) INTRON IS NOT
```

MISCELLANEOUS: CONVERSION OF FIBRINOGEN TO FIBRIN IS TRIGGERED BY THROMBIN, WHICH CLEAVES FIBRINOPEPTIDES A AND B FROM ALPHA & BETA CHAINS, AND THOS EXPOSES THE N-TERMINAL POLYMERIZATION SITES RESPONSIBLE FOR THE FORMATION OF THE SOFT CLOT. THE SOFT CLOT IS CONVERTED INTO THE HARD CLOT BY FACTOR XIIIA WHICH CATALYZES THE EPSILON-(GAMMA-GLUTAMYL)LYSINE CROSS-LINKING BETWEEN GAMMA CHAINS OF DIFFERENT

MISCELLANEOUS: THE GAMMA-B CHAIN IS PRESENT IN ABOUT 10% OF THE FIBRINOGEN MOLECULES IN PLASMA BUT ABSENT FROM THOSE IN THE (STRONGER) AND BETWEEN ALPHA CHAINS (WEAKER)

PLATELETS.

```

```
A; Description: fibrinogen cleaved by thrombin yields monomers that are polymerized in A; Pathway: blood coagulation
C; Superfamily: fibrinogen gamma chain; fibrinogen beta/gamma homology
C; Keywords: alternative splicing; blood coagulation; calcium; coiled coil; glycoprote

C.Comment: The two forms of gamma chain, A (see PIR:FGHUG) and B, arise by alternate splantron, which makes this chain different from the gamma-B chain at positions 434-437 and C.Comment: The gamma-B chain is present in about 10% of the fibrinogen molecules in plase C.Genetics:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A; Map position: 4q28-4q28

A WILLIE Disullide bridges in NR 2-terminal part of human fibrinogen.

A Wordstoners: disulfide brodges in NR 2-terminal part of human fibrinogen.

A Wordstoners: disulfide brodges in NR 12-terminal part of human fibrinogen.

A Wordstoners: disulfide brodges in NR 12-terminal part of the A Wordstoners: disulfide brodges with the A Wordstoners and A Wordstoners and A Wordstoners.

B Wondstoners: disulfide brodges with the A Wordstoners are a wordstoners.

B Wondstoners: distriction of proteins associated with apolipoprotein A T-containing lip A Wordstoners.

A Wordstoners: distriction of proteins associated with apolipoprotein A T-containing lip A Wordstoners.

A Wordstoners: distriction of Wordstoners associated with apolipoprotein A T-containing lip A Wordstoners.

A Wordstoners: distriction of Wordstoners and Wordstoners.

A Wordstoners: distriction of Wordstoners and Wordstoners.

A Wordstoners: distriction of Wordstoners and Wordstoners.

A Wordstoners: distriction of Wor

restrictin precursor - chicken
C;Species: Gallus gallus (chicken)
C;Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 10-Sep-1999
C;Accession: JH6675; PS0385; S23254
R;Noerenberg, U.; Wille, H.; Wolff, J.M.; Frank, R.; Rathjen, F.G.
Neuron 8, 849-863, 1992
A;Title: The chicken neural extracellular matrix molecule restrictin: similarity with
                                                                                                                                                                                                                                                                                                                                                                                               A. Mocession: 502443
A. Molecule type: protein
A. Mesidues: 373-374 cMED>
C. Comment: Thrombin cleaves the bond between Arg-21 and Gly-22 to release fibrinopept
C. Comment: Fibrinogen is a hexamer containing two sets of three nonidentical chains (C. Superfamily: fibrinogen beta chain; fibrinogen beta/damma homology; fibrinogen disulfide ring homology cFDR>
F. 76-205/Domain: fibrinogen beta/gamma homology cFDR>
F. 17-464/Domain: fibrinogen beta/gamma homology cFDR>
F. Modified site: pyrrolidone carboxylic acid (Gln) #status experimental
F. Affinding site: sulfate (Tyr) (covalent) #status experimental
F. 371/Binding site: carbohydrate (Asn) (covalent) #status predicted
F. 372-373/Cleavage site: Arg-1hr (plasmin) #status experimental
                                                                      A; Accession: A37513
A; Molecule type: mRNA
A; Residues: 44.468 < CHU>

Note: sequence extracted from NCBI backbone (NCBIP:119917)
C;Comment: The alpha chain binds by 2-4 cross-links to the amino end of fibronectin.
C;Comment: The conversion of fibrinogen to fibrin is triggered by thrombin, which cle ization sites responsible for the formation of the soft clot.
C;Comment: The soft clot is converted into the hard clot by factor XIIIa (fibrin-stab ger) and between alpha chains (weeker) of different monomers.
C;Comment: All fibrinogen chains are synthesized in the liver.
C;Comment: See PIR:FGHUA for the major splice form. It is not known whether this form

                                                                                                                                                                  This is the amino acid sequence of mouse prothrombinase Fgl2, as predicted from fgl2 DNA (see V84140). Fgl2 is a 70 kDa transmembrane serine protease that has immune procoagulant activity. The human Fgl2 amino acid sequence is given in W88236. The invention provides a method for inhibiting immune coagulation by inhibiting the activity or expression of Fgl2. The method can be used in vivo to treat a condition which requires a reduction in immune coagulation such as bacterial and viral infections, cancer, glomerulonephritis, a number of gastrointestinal diseases, allograft and xenograft rejection and foetal loss. An Fgl2-specific
                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                            predicted from highl DNA (see V84139). Fgll is a 70 kDa transmembrane serine protease that has immune procoagulant activity. The invention provides a method for inhibiting immune coagulation by inhibiting the activity or expression of Fgll. The method can be used in vivo to treat a condition which requires a reduction in immune coagulation such as bacterial and viral infections, cancer, glomerulonephritis, a number of gastrointestinal diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  allograft and xenograft rejection and foetal loss. An F912-specific antibody, an F912 antisense oligonucleotide, or a substance that affects prothrombinase activity of a F912 protein may be used to treat a condition requiring a reduction in procoagulant activity. A vaccine containing an F912 protein or peptide is used for prevention of graft rejection or foetal loss (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   7; Gaps

Its amino acid sequence was deduced from a cDNA clone (T44321) derived from human foetal lung cells. TIE-2 ligand 2 is a receptor antagonist useful for blocking blood vessel growth, for tumour therapy and for treating a proliferative disorder of a blood forming organ. It can be obtd. from natural sources or expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         :: : :| || : :: |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 R94605 is a human TIE-2 (hTIE-2) ligand 2 derived from a pBluescript KS clone. hTIE-2 ligand DNAs of the invention are recombinant versions of the native ligand coding sequences and may be used to produce the ligands at a high yield. Antibodies and receptor bodies that bind to TIE-2 ligands may be used to inhibit angiogenesis and neovascularisation (e.g. associated with tumour development) and the TIE-2 ligands themselves are useful to promote neovascularisation and wound healing e.g. for treatment of ischamia. TIE-2 ligands are also useful to diabetes. Ligand bodies contg. TIE-2 ligands may also be useful for the delivery and targeting of growth factors, toxins etc. to sites where their presence is advantageous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  53 crsssspyvsnavgrdapleyddsvgrlgvlenimenntgwlmklenyigdnmkkemvel 112

This is the amino acid sequence of the human TIE-2 ligand 2, used in the method of the invention, involving the production of TIE-2 ligands which promote healing. The nucleic acids, vectors and host cells used in the method of the invention are useful for the recombinant production of the ligands. The ligands, etc. are useful for blocking blood vessel growth, promoting neovascularisation, promoting the growth or differentiation of a cell expressing the TIE receptor, blocking the growth or differentiation of a cell expressing the TIE receptor and for attenuating or preventing tumour growth in

This sequence represents the human angiopoietin-2 (Ang-2) amino acid sequence. Ang-2 is a naturally occurring angiogenesis antagonist when vascular endothelial growth factor (VEGF) levels are low, and generally counteracts the blood vessel maturation and stability mediated by Ang-1. Ang-1 is a naturally occurring angiogenesis agonist, and is a maturation or stabilisation factor, converting immature vessels to mature vessels. Both Ang-1 and Ang-2 are useful in a therapeutic approach to the treatment of vascularised tumours. The invention relates to a binding ligand comprising a targeting agent that binds to an aminophospholipid, and specific markers accessible on the luminal surface of tumour blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; angiopoietin-2; Ang-2; aminophospholipid; vascularised tumour;
unconjugated anti-aminophospholipid antibody; tumour blood vessel marker;
cancer; treatment; angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                        vessels. The binding ligand induces coagulation (thrombosis) in tumour vasculature or causes tumour necrosis (possibly by cell- or complement-mediated cytotoxicity and/or apoptosis). The binding ligands are used to treat vascularised tumours, malignant or benign, in animals,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              98 KLQADDHR-----DPGGNGGNGAETAEDSR-VQELESQV-------NKL 133

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               οy
                                                                                                                                                                                                                                                                                                                                                                                                                    sequence. Ang. 2 is a naturally occurring angiogenesis antagonist when vascular endothelial growth factor (VEGF) levels are low, and generally counteracts the blood vessel maturation and stability mediated by Ang-1. Ang. 1 is a naturally occurring angiogenesis agonist, and is a maturation or stabilisation factor, converting immature vessels to mature vessels. Both Ang-1 and Ang-2 are useful in a therapeutic approach to the treatment of vascularised tumours. The invention relates to a composition comprising an anti-aminophospholipid antibody, or its antigen binding region. The composition is used to kill tumour vasculature endothelial calls. Aminophospholipids are stable and specific markers accessible on the luminal surface of tumour blood vessels. Ang-1 or Ang-2 may be used in the composition of the invention. The composition is used to treat malignant or benign vascularised tumours in animals, especially large
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               16;

This is the amino acid sequence of the chimeric TIE ligand INIC2F, used in the method of the invention, involving the production of TIE-2 ligands which promote healing. The nucleic acids, vectors and host calls used in the method of the invention are useful for the recombinant production of the ligands. The ligands, etc. are useful for blocking blood vessel growth, promoting neovascularisation, promoting the growth or differentiation of a cell expressing the receptor, blocking the growth or differentiation of a cell expressing the TIE receptor and for attenuating or preventing tumour growth in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              avgnhtatmleigtslisgtaegtrkltdvetgvlngtsrleigllenslstyklekgll 178
